The screenshot shows a web browser window with the title bar "CVS - Open Source Version" and the address bar "cvs.nongnu.org". The main content area displays the CVS homepage with the following sections:

- CVS - Concurrent Versions System**
- [Introduction](#) | [News](#) | [Documentation](#) | [Get the Software](#) | [Help and Bug Reports](#) | [Development](#)
- Introduction to CVS**

CVS is a version control system, an important component of Source Configuration Management (SCM). Using it, you can record the history of sources files, and documents. It fills a similar role to the free software [RCS](#), [PRCS](#), and [Aegis](#) packages.

CVS is a production quality system in wide use around the world, including many free software projects.

While CVS stores individual file history in the same format as RCS, it offers the following significant advantages over RCS:

 - It can run scripts which you can supply to log CVS operations or enforce site-specific policies.
 - **Client/server** CVS enables developers scattered by geography or slow modems to function as a single team. The version history is stored on a single central server and the client machines have a copy of all the files that the developers are working on. Therefore, the network between the client and the server must be up to perform CVS operations (such as checkins or updates) but need not be up to edit or manipulate the current versions of the files. Clients can perform all the same operations which are available locally.
 - In cases where several developers or teams want to each maintain their own version of the files, because of geography and/or policy, CVS's **vendor branches** can import a version from another team (even if they don't use CVS), and then CVS can merge the changes from the vendor branch with the latest files if that is what is desired.
 - **Unreserved checkouts**, allowing more than one developer to work on the same files at the same time.
 - CVS provides a flexible **modules database** that provides a symbolic mapping of names to components of a larger software distribution. It applies names to collections of directories and files. A single command can manipulate the entire collection.
 - CVS servers run on most unix variants, and clients for Windows NT/95, OS/2 and VMS are also available. CVS will also operate in what is sometimes called server mode against local repositories on Windows 95/NT.
- CVS News**

Recent CVS news, including release announcements, are posted on the [Current events page](#). To receive the same news via email, subscribe to the [cvs-announce mailing list](#) (these announcements are duplicated on the bug-cvs@nongnu.org and info-cvs@nongnu.org [mailing lists](#)).
- CVS Documentation**

The [CVS Information Page](#) contains detailed, and current information on CVS.

Fenway Park's 100th Anniversary
For the then-princely sum of \$650,000 (about \$16 million in today's dollars), the citizens of Boston received in 1912 one of the most renowned sports venues in the world: Fenway Park. A century later, the stadium that nurtured a young Babe Ruth and witnessed the miraculous hitting of Ted Williams is still in use ... and the score is still updated by hand.

Syntax is the study of grammar

142

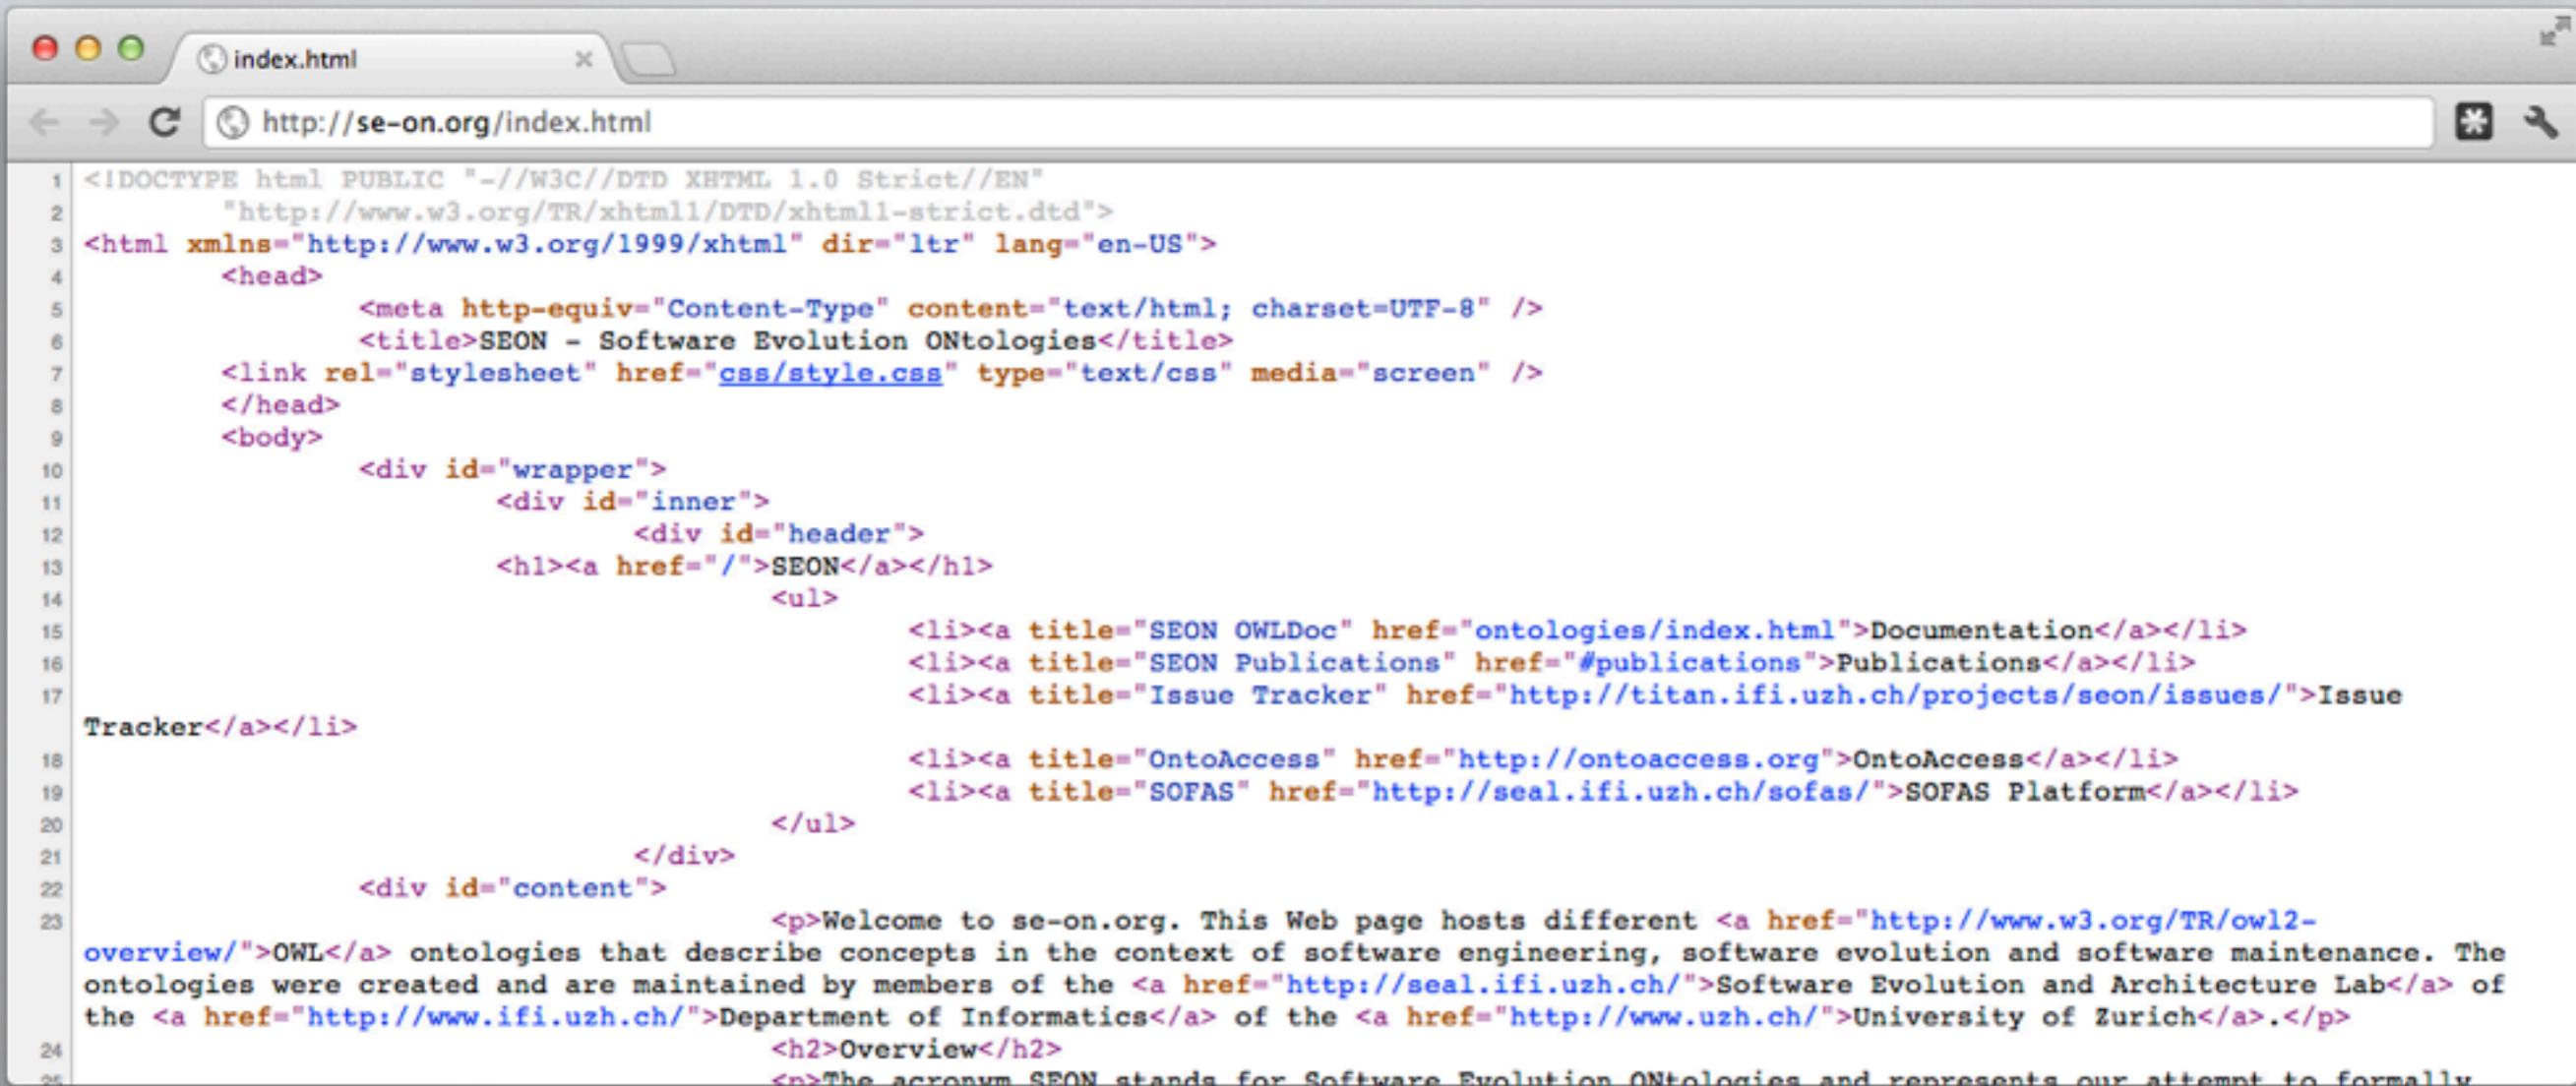

The background image shows a modern library interior. It features long, grey, curved bookshelves filled with books. The floor is a light grey carpet. In the center of the image, there is a rectangular reading area with a small table and chairs. The ceiling is white with some pipes and lights. There are also some green exit signs on the ceiling.

Semantics is the study of meaning

A photograph of four people sitting in a circle on white chairs, engaged in a group discussion. A man in a light-colored turtleneck sweater is gesturing while speaking. A woman in a tan blazer is listening attentively with her hand to her chin. Another person's legs are visible in the foreground, and a fourth person is partially visible on the right. The setting is a bright room with a light-colored floor.

Syntax and semantics are
all about **communication**

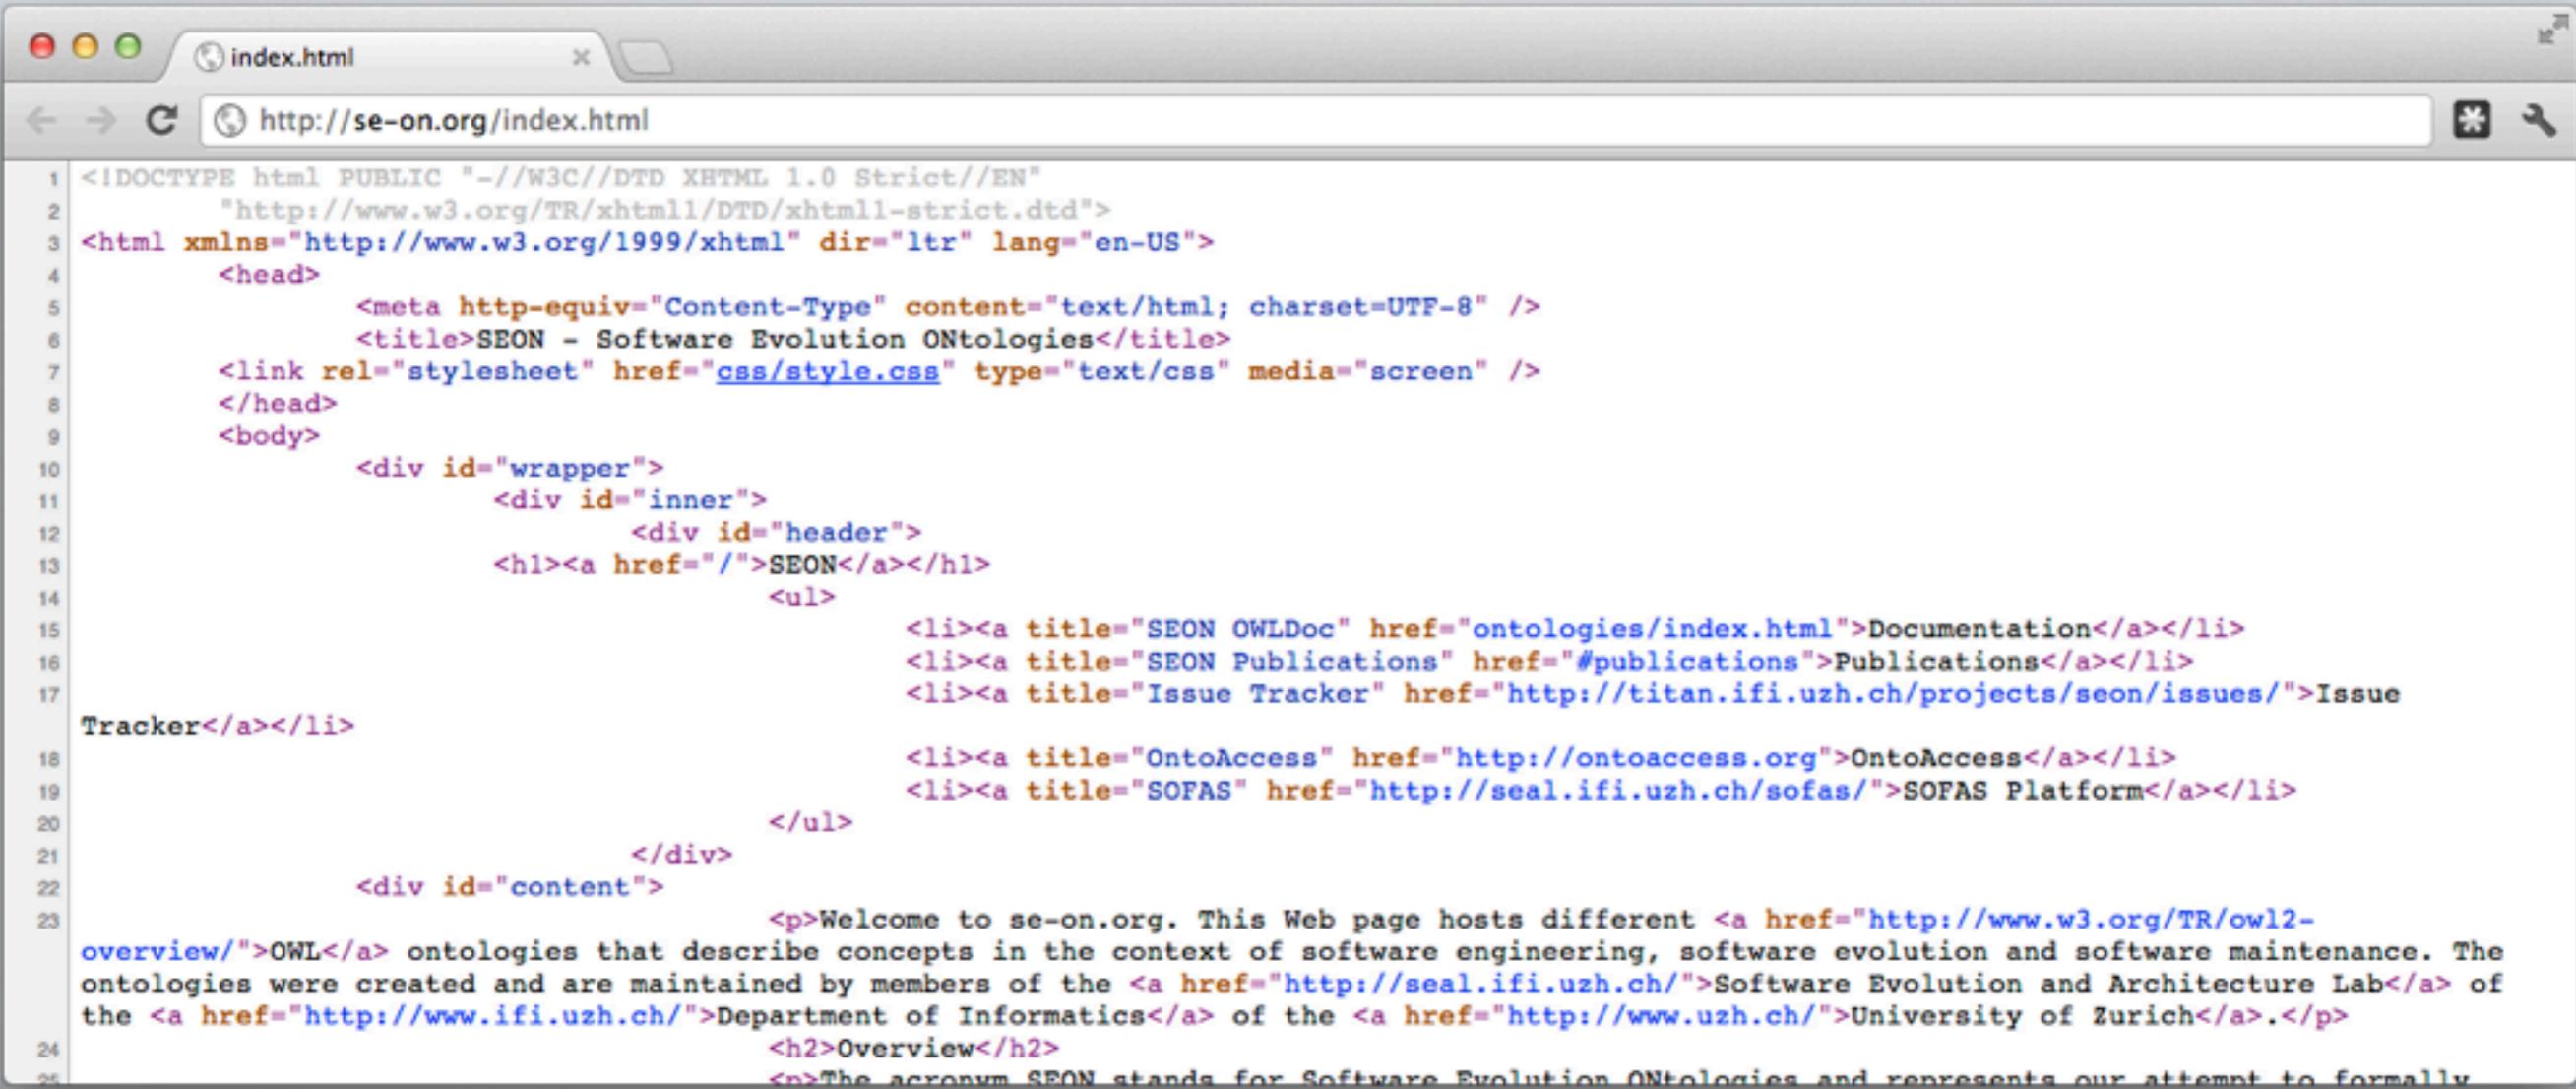

HTML describes the **structure** of information

The screenshot shows a web browser window with the title bar "index.html" and the URL "http://se-on.org/index.html". The page content is displayed as a block of HTML code, which is color-coded for syntax highlighting. The code includes doctype declarations, XML namespaces, head and body sections, meta tags, titles, links, and a navigation menu.

```
1 <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"
2   "http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
3 <html xmlns="http://www.w3.org/1999/xhtml" dir="ltr" lang="en-US">
4   <head>

CONCLUSIONS

Single point of access for information needs in IDEs

Natural language queries vs complicated UIs

Semantic Web technology is gaining ground very quickly!

A screenshot of a web browser window showing the Hawkshaw website at <http://titan.ifl.uzh.ch/release/hawkshaw-dev/>. The page features a logo of a blue owl with the text "hawkshaw Talking to your IDE". A navigation bar includes links for Installation, Tutorial, Report an Issue, Publications, Seon Ontologies, and Contact Developer. The main content area contains a large heading "Hawkshaw" and a paragraph describing the tool's purpose: "Hawkshaw is a research prototype developed at the Software Evolution and Architecture Lab of the Department of Informatics of the University of Zurich. It is powered by semantic Web technology and connects to a query natural-language interface to solve evolution data and is fully integrated into the Eclipse IDE. In other words, it enables you to ask natural-language questions in Eclipse, such as 'What methods invoke method XYZ?' or 'What bugs affected this class?'". Below this is a "Change Log" section.

Change Log

Please visit our [Issue Tracker](#) for a more detailed description of recent development efforts.

A screenshot of a web browser window showing the SEON website at [http://se-on.org/](http://se-on.org). The page has a header with the text "SEON" and "A Family of Software Evolution ONtologies". A navigation bar includes links for Documentation, Publications, Issue Tracker, OntoAccess, and SOFAS Platform. The main content area contains a welcome message: "Welcome to se-on.org. This Web page hosts different OWL ontologies that describe concepts in the context of software engineering, software evolution and software maintenance. The ontologies were created and are maintained by members of the Software Evolution and Architecture Lab of the Department of Informatics of the University of Zurich." Below this is an "Overview" section and a "The 5 Layers of SEON" section.

Overview

The acronym SEON stands for Software Evolution ONtologies and represents our attempt to formally describe knowledge from the domain of software evolution analysis and mining software repositories. SEON consists of multiple ontologies, for example to describe stakeholders, activities, artifacts, and the relations among all of them. The ultimate goal is to facilitate the implementation of tools that help software engineers to manage software systems over their entire life-cycle.

The 5 Layers of SEON

The figure below presents an overview of the different layers of SEON. Its most distinguishing feature is, compared to other
