

# Arrays

## Chapter 7

---

---

---

---

---

---

---

---

## Objectives

- Nature and purpose of an array
- Using arrays in Java programs
- Methods with array parameter
- Methods that return an array
- Array as an instance variable
- Use an array not filled completely

---

---

---

---

---

---

---

---

## Objectives, cont.

- Order (sort) the elements of an array
- Search an array for a particular item
- Define, use multidimensional array

---

---

---

---

---

---

---

---

## Creating and Accessing Arrays

- An array is a special kind of object
- Think of as collection of variables of same type
- Creating an array with 7 variables of type double

```
double[] temperature = new double[7];
```

- To access an element use
  - The name of the array
  - An index number enclosed in braces
- Array indices begin at zero

---

---

---

---

---

---

---

---

## Creating and Accessing Arrays

---

---

---

---

---

---

---

---

## Array Details

- Syntax for declaring an array with **new**

```
Base_Type[] Array_Name = new Base_Type[Length];
```

- The number of elements in an array is its length
- The type of the array elements is the array's base type

---

---

---

---

---

---

---

---

## Square Brackets with Arrays

- With a data type when declaring an array  
`int [ ] pressure;`
- To enclose an integer expression to declare the length of the array  
`pressure = new int [100];`
- To name an indexed value of the array  
`pressure[3] = keyboard.nextInt();`

---

---

---

---

---

---

---

---

## Array Details

---

---

---

---

---

---

---

---

## The Instance Variable `length`

- As an object an array has only one public instance variable
  - Variable `length`
  - Contains number of elements in the array
  - It is final, value cannot be changed
- example code  
`class ArrayOfTemperatures2`

---

---

---

---

---

---

---

---

## More About Array Indices

- Index of first array element is 0
- Last valid Index is `arrayName.length - 1`
- Array indices must be within bounds to be valid
  - When program tries to access outside bounds, run time error occurs
- OK to "waste" element 0
  - Program easier to manage and understand
  - Yet, get used to using index 0

---

---

---

---

---

---

---

---

## Initializing Arrays

- Possible to initialize at declaration time
- ```
double[] reading = {3.3, 15.8, 9.7};
```
- Also may use normal assignment statements
    - One at a time
    - In a loop

```
int[] count = new int[100];  
for (int i = 0; i < 100; i++)  
    count[i] = 0;
```

---

---

---

---

---

---

---

---

## Case Study: Sales Report

- Program to generate a sales report
- Class will contain
  - Name
  - Sales figure
- View class declaration, listing 7.3  
`class SalesAssociate`

---

---

---

---

---

---

---

---

## Case Study: Sales Report

| SalesReporter                                                                                             |
|-----------------------------------------------------------------------------------------------------------|
| - highestSales: double<br>- averageSales: double<br>- team: SalesAssociate[]<br>- numberOfAssociates: int |
| + getData(): void<br>+ computeStats(): void<br>+ displayResults(): void                                   |

---

---

---

---

---

---

---

---

## Case Study: Sales Report

class SalesReporter

```
Enter number of sales associates:
3
Enter data for associate number 1
Enter name of sales associate: Dusty Rhodes
Enter associate's sales: $36000
Enter data for associate number 2
Enter name of sales associate: Natalie Dressed
Enter associate's sales: $50000
Enter data for associate number 3
Enter name of sales associate: Sandy Hair
Enter associate's sales: $10000
Average sales per associate is $32000.0
```

Sample  
screen  
output

---

---

---

---

---

---

---

---

## Indexed Variables as Method Arguments

- Indexed variable of an array
    - Example ... `a[i]`
    - Can be used anywhere variable of array base type can be used
  - View [program](#) using indexed variable as an argument, listing 7.5
- class ArgumentDemo

---

---

---

---

---

---

---

---

## Entire Arrays as Arguments

- Declaration of array parameter similar to how an array is declared
- Example:

```
public class SampleClass
{
    public static void incrementArrayBy2(double[] anArray)
    {
        for (int i = 0; i < anArray.length; i++)
            anArray[i] = anArray[i] + 2;
    }
    <The rest of the class definition goes here.>
}
```

---

---

---

---

---

---

---

---

## Entire Arrays as Arguments

- Note – array parameter in a method heading does not specify the length
  - An array of any length can be passed to the method
  - Inside the method, elements of the array can be changed
- When you pass the entire array, do not use square brackets in the actual parameter

---

---

---

---

---

---

---

---

## Arguments for Method main

- Recall heading of method `main`  
`public static void main (String[] args)`
- This declares an array
  - Formal parameter named `args`
  - Its base type is `String`
- Thus possible to pass to the run of a program multiple strings
  - These can then be used by the program

---

---

---

---

---

---

---

---

## Array Assignment and Equality

- Arrays are objects
  - Assignment and equality operators behave (misbehave) as specified in previous chapter
- Variable for the array object contains memory address of the object
  - Assignment operator = copies this address
  - Equality operator == tests whether two arrays are stored in same place in memory

---

---

---

---

---

---

---

---

## Array Assignment and Equality

- Two kinds of equality
- View [example program](#), listing 7.6  
`class TestEquals`

Not equal by ==.  
Equal by the equals method.

Sample  
screen  
output

---

---

---

---

---

---

---

---

## Array Assignment and Equality

- Note results of ==
- Note definition and use of method `equals`
  - Receives two array parameters
  - Checks length and each individual pair of array elements
- Remember array types are reference types

---

---

---

---

---

---

---

---

## Methods that Return Arrays

- A Java method may return an array
- View [example program](#), listing 7.7  
`class ReturnArrayDemo`
- Note definition of return type as an array
- To return the array value
  - Declare a local array
  - Use that identifier in the `return` statement

---

---

---

---

---

---

---

---

## Programming with Arrays and Classes: Outline

- Programming Example: A Specialized List Class
- Partially Filled Arrays

---

---

---

---

---

---

---

---

## Programming Example

- A specialized List class
  - Objects can be used for keeping lists of items
- Methods include
  - Capability to add items to the list
  - Also delete entire list, start with blank list
  - But no method to modify or delete list item
- Maximum number of items can be specified

---

---

---

---

---

---

---

---

## Programming Example

- View [demo program](#), listing 7.8
- `class ListDemo`
- Note declaration of the list object
- Note method calls

© 2005 W. Savitch, Pearson Prentice Hall

25

---

---

---

---

---

---

---

---

## Partially Filled Arrays

- Array size specified at definition
- Not all elements of the array might receive values
  - This is termed a *partially filled array*
- Programmer must keep track of how much of array is used

© 2005 W. Savitch, Pearson Prentice Hall

26

---

---

---

---

---

---

---

---

## Partially Filled Arrays

- Figure 7.4 A partially filled array

© 2005 W. Savitch, Pearson Prentice Hall

27

---

---

---

---

---

---

---

---

## Sorting, Searching Arrays: Outline

- Selection Sort
- Other Sorting Algorithms
- Searching an Array

© 2005 W. Savitch, Pearson Prentice Hall

28

---

---

---

---

---

---

---

---

## Selection Sort

- Consider arranging all elements of an array so they are ascending order
- Algorithm is to step through the array
  - Place smallest element in index 0
  - Swap elements as needed to accomplish this
- Called an interchange sorting algorithm

© 2005 W. Savitch, Pearson Prentice Hall

29

---

---

---

---

---

---

---

---

## Selection Sort

- Figure 7.5a

© 2005 W. Savitch, Pearson Prentice Hall

30

---

---

---

---

---

---

---

---

## Selection Sort

Figure 7.5b

© 2005 W. Savitch, Pearson Prentice Hall

31

---

---

---

---

---

---

---

---

## Other Sorting Algorithms

- Selection sort is simplest
  - But it is very inefficient
- Java Class Library provides for efficient sorting
  - Has a class called Arrays
  - Class has multiple versions of a sort method

© 2005 W. Savitch, Pearson Prentice Hall

32

---

---

---

---

---

---

---

---

## Searching an Array

- Method used in `OneWayNoRepeatsList` is sequential search
  - Looks in order from first to last
  - Good for unsorted arrays
- Search ends when
  - Item is found ... or ...
  - End of list is reached
- If list is sorted, use more efficient searches

© 2005 W. Savitch, Pearson Prentice Hall

33

---

---

---

---

---

---

---

---

## Multidimensional Arrays: Outline

- Multidimensional-Array Basics
- Multidimensional-Array Parameters and Returned Values
- Java's Representation of Multidimensional
- Ragged Arrays
- Programming Example: Employee Time Records

---

---

---

---

---

---

---

---

## Multidimensional-Array Basics

- Consider Figure 7.6, a table of values

Savings Account Balances for Various Interest Rates Compounded Annually  
(Rounded to Whole Dollar Amounts)

| Year | 5.00%  | 5.50%  | 6.00%  | 6.50%  | 7.00%  | 7.50%  |
|------|--------|--------|--------|--------|--------|--------|
| 1    | \$1050 | \$1055 | \$1060 | \$1065 | \$1070 | \$1075 |
| 2    | \$1103 | \$1113 | \$1124 | \$1134 | \$1145 | \$1156 |
| 3    | \$1158 | \$1174 | \$1191 | \$1208 | \$1225 | \$1242 |
| 4    | \$1216 | \$1239 | \$1262 | \$1286 | \$1311 | \$1335 |
| 5    | \$1276 | \$1307 | \$1338 | \$1370 | \$1403 | \$1436 |
| 6    | \$1340 | \$1379 | \$1419 | \$1459 | \$1501 | \$1543 |
| 7    | \$1407 | \$1455 | \$1504 | \$1554 | \$1606 | \$1659 |
| 8    | \$1477 | \$1535 | \$1594 | \$1655 | \$1718 | \$1783 |
| 9    | \$1551 | \$1619 | \$1689 | \$1763 | \$1838 | \$1917 |
| 10   | \$1629 | \$1708 | \$1791 | \$1877 | \$1967 | \$2061 |

---

---

---

---

---

---

---

---

## Multidimensional-Array Basics

- Figure 7.7 Row and column indices for an array named `table`

| Indices | 0      | 1      | 2      | 3      | 4      | 5      |
|---------|--------|--------|--------|--------|--------|--------|
| 0       | \$1050 | \$1055 | \$1060 | \$1065 | \$1070 | \$1075 |
| 1       | \$1103 | \$1113 | \$1124 | \$1134 | \$1145 | \$1156 |
| 2       | \$1158 | \$1174 | \$1191 | \$1208 | \$1225 | \$1242 |
| 3       | \$1216 | \$1239 | \$1262 | \$1286 | \$1311 | \$1335 |
| 4       | \$1276 | \$1307 | \$1338 | \$1370 | \$1403 | \$1436 |
| 5       | \$1340 | \$1379 | \$1419 | \$1459 | \$1501 | \$1543 |
| 6       | \$1407 | \$1455 | \$1504 | \$1554 | \$1606 | \$1659 |
| 7       | \$1477 | \$1535 | \$1594 | \$1655 | \$1718 | \$1783 |
| 8       | \$1551 | \$1619 | \$1689 | \$1763 | \$1838 | \$1917 |
| 9       | \$1629 | \$1708 | \$1791 | \$1877 | \$1967 | \$2061 |

---

---

---

---

---

---

---

---

## Multidimensional-Array Basics

- We can access elements of the table with a nested for loop
- Example:

```
for (int row = 0; row < 10; row++)  
  for (int column = 0; column < 6; column++)  
    table[row][column] =  
      balance(1000.00, row + 1, (5 + 0.5 * column));
```

- View [sample program](#), listing 7.12  
`class InterestTable`

---

---

---

---

---

---

---

---

## Multidimensional-Array Basics

Balances for Various Interest Rates Compounded Annually  
(Rounded to Whole Dollar Amounts)

| Years | 5.00%  | 5.50%  | 6.00%  | 6.50%  | 7.00%  | 7.50%  |
|-------|--------|--------|--------|--------|--------|--------|
| 1     | \$1050 | \$1055 | \$1060 | \$1065 | \$1070 | \$1075 |
| 2     | \$1103 | \$1113 | \$1124 | \$1134 | \$1145 | \$1156 |
| 3     | \$1158 | \$1174 | \$1191 | \$1208 | \$1225 | \$1242 |
| 4     | \$1216 | \$1239 | \$1262 | \$1286 | \$1311 | \$1335 |
| 5     | \$1276 | \$1307 | \$1338 | \$1370 | \$1403 | \$1436 |
| 6     | \$1340 | \$1379 | \$1419 | \$1459 | \$1501 | \$1543 |
| 7     | \$1407 | \$1455 | \$1504 | \$1554 | \$1606 | \$1659 |
| 8     | \$1477 | \$1535 | \$1594 | \$1655 | \$1718 | \$1783 |
| 9     | \$1551 | \$1619 | \$1689 | \$1763 | \$1838 | \$1917 |
| 10    | \$1629 | \$1708 | \$1791 | \$1877 | \$1967 | \$2061 |

---

---

---

---

---

---

## Multidimensional-Array Parameters and Returned Values

- Methods can have
  - Parameters that are multidimensional-arrays
  - Return values that are multidimensional-arrays
- View [sample code](#), listing 7.13  
`class InterestTable2`

---

---

---

---

---

---

---

---

## Java's Representation of Multidimensional Arrays

- Multidimensional array represented as several one-dimensional arrays
- Given
 

```
int [][] table = new int [10][6];
```
- Array table is actually 1 dimensional of type `int []`
  - It is an array of arrays
- Important when sequencing through multidimensional array

---

---

---

---

---

---

---

---

## Programming Example

| Employee  | 1  | 2  | 3  | Totals |
|-----------|----|----|----|--------|
| Monday    | 8  | 0  | 9  | 17     |
| Tuesday   | 8  | 0  | 9  | 17     |
| Wednesday | 8  | 8  | 8  | 24     |
| Thursday  | 8  | 8  | 4  | 20     |
| Friday    | 8  | 8  | 8  | 24     |
| Total =   | 40 | 24 | 38 |        |

Sample screen output
