
Solutioning Architectures

What does an IT Architect need to be effective?

9. August 2011

Kai Schwidder

- The skills you need to be an IT Architect

- Judge
- Visualize
- Communicate

- This will be illustrated through the three “Cs”:

- Context
- Common Sense
- Communication

Creates workable concepts

- Accountable for the integrity of the customer solution
- Recognised lead technical authority
- Able to architect full solution although focus will vary due to differing background and experience
- Capable of delving into detail when required
- Full life cycle, i.e. from concept, through development & roll-out to support/managed service
- Strong leadership, technical & communication skills
- Ability and willingness to mentor and coach

Overall, the architect is a specialist in reducing:

- Complexity
- Uncertainty
- Ambiguity

The fundamental skill of an IT Architect is to understand the context they are working in

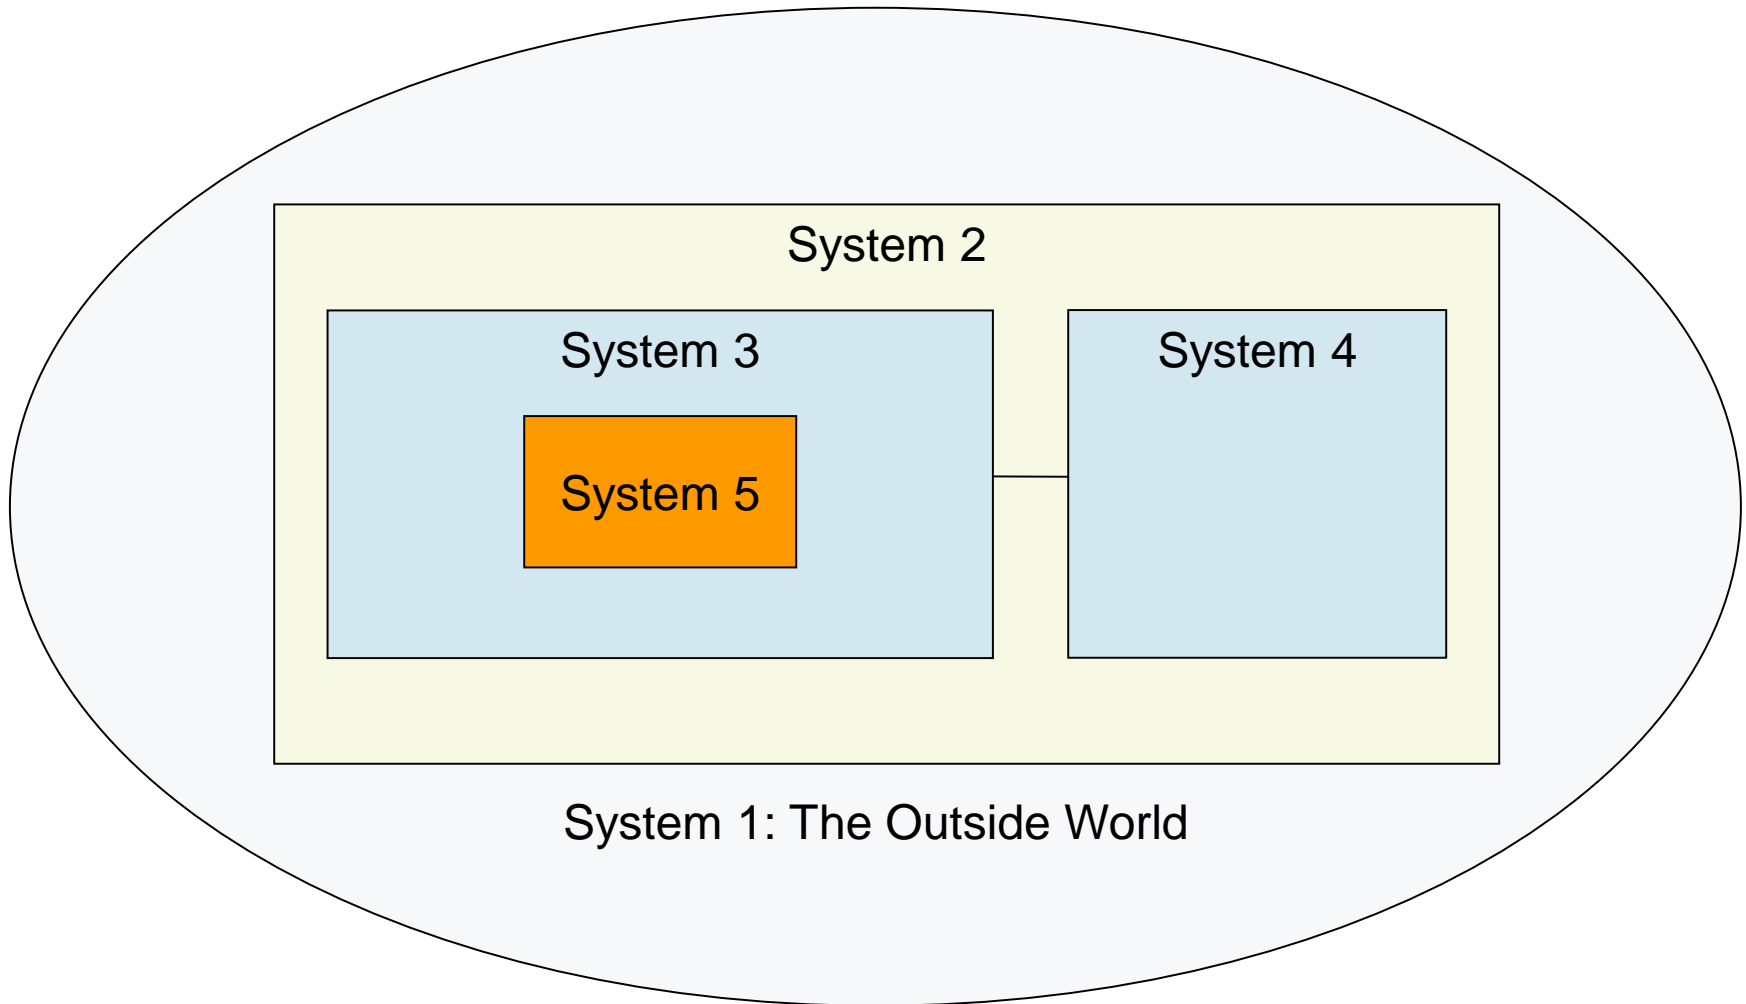

Putting IT architecture in context itself – why do we need it?

- System context and boundaries
- Architecture context – aspects of architecture
- Project context

Finding the system boundaries

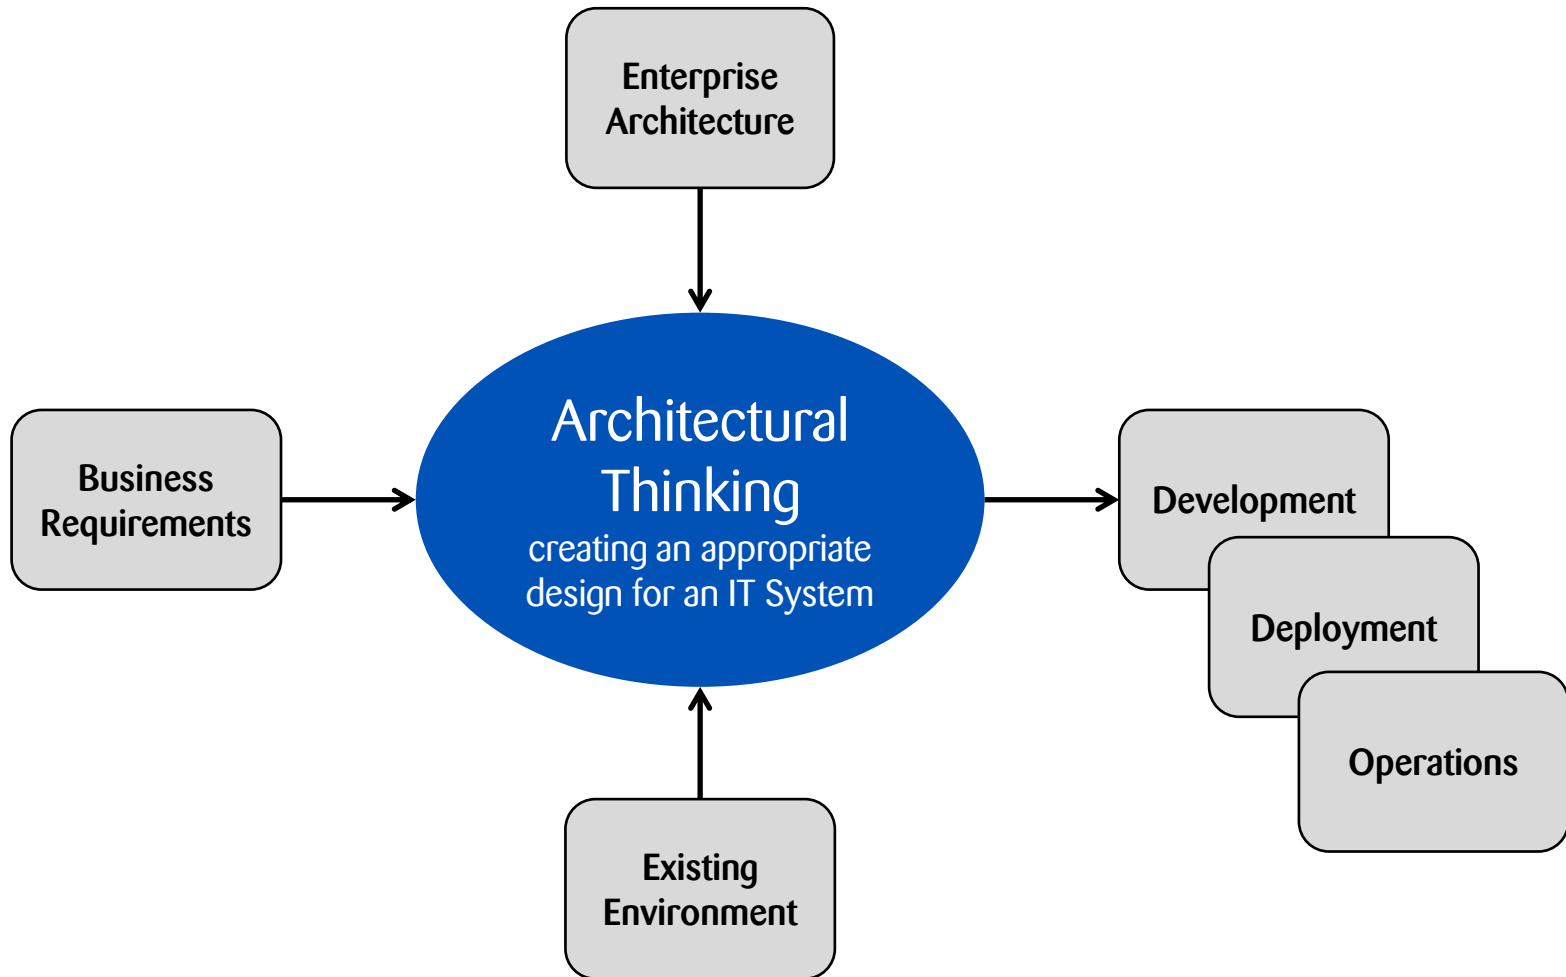

Architectural Thinking should lead to a complete systems architecture that serves multiple purposes

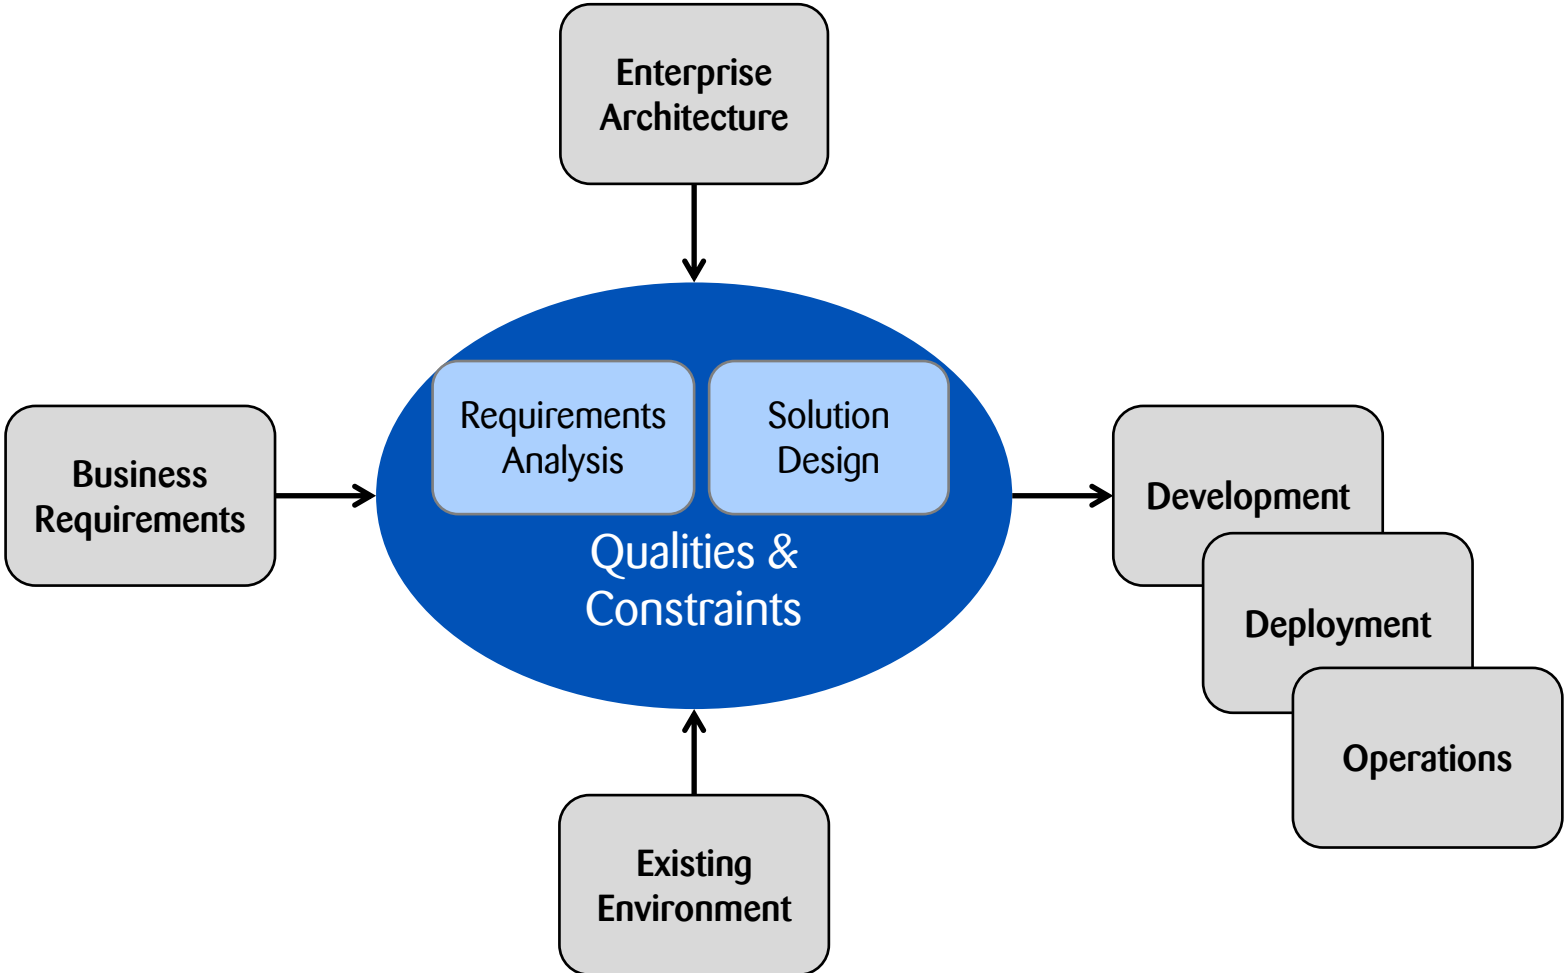

- It breaks down the complexity of the IT system
- It analyses the required functionality to identify required technical components
- It provides a basis for the specification of the physical computer systems
- It defines the structuring and strategy for connection of system elements
- It provides the rules of composition / decomposition of system elements
- It assists in the analysis of service level requirements to design a means of delivery
- It provides a decision trail which allows the system to evolve over time

Architectural Thinking : Balancing many forces

The IT Architect focuses on the following aspects

Architectural decisions are made in context of the overall management of the project

You need to understand your project's context:

- Be the project manager's best friend
- Consider cost and budget implications

How much will it cost?

- Is it built to order?
- Is it built to cost?

Changing one side will always have an affect on the other two sides.

The Process of Architecting

The Normative way

- Schools of architecture
- Dogma

The Rational way

- Procedure driven
- Logical

The Argumentative way

- Mechanistic
- Brainstorming

Just use common sense (heuristic reasoning)

The knowledge of what is reasonable within a given context.

- Includes insights, lessons learned and rules of thumb

Heuristics can be prescriptive...

- Keep It Simple, Stupid

...or descriptive

- If anything can go wrong, it will.

The simplest solution is usually the correct one.

And be aware of the following ...

Requirements

- Don't assume the original statement of the problem is necessarily the best, or even the right, one.
- Success is defined by the user, not the architect.

Design

- You can't avoid redesign, or if first you don't succeed...
- No system can be optimum for all users (or all database accesses!)

Development

- Quality cannot be tested in, it has to be built in.
- Something good enough in a small system is unlikely to be good enough in a complex one.

Test

- Testing is a system in itself.
- Regardless of everything, the acceptance criteria determine what gets built.
- The sooner you find the problem, the cheaper it is to fix it.

Why do we need a Method to communicate ?

- Provides a mechanism to enable a common language among all practitioners delivering business solutions
- Fundamental component to accelerating the Global Services' shift to asset based services, providing a mechanism for practitioners to reuse knowledge and assets using a consistent, integrated approach
- Shifting from labour based to asset based services positions Global Services to compete more effectively in the marketplace by increasing productivity and minimizing cost, risk, and time to market

The weapons of the IT Architect...

As with all weapons, they need to be used carefully to stop you getting hurt.

Communication skills are important for a successful IT Architect

Spoken Communication

- The IT Architect is often asked to present their solution
- Different audiences require different approaches
 - Business sponsor, project manager, developer...

Written Communication

- An undocumented architecture is difficult to build and maintain; it leads to a lot of repeat discussions.
- Architectural documentation can be a time-saver, not a time-waster.
- Documentation is extracted from work products, but focuses on key messages and stakeholder needs

Why are Patterns important?

A Pattern is a *reusable* generalization (or abstraction) that can be used as the starting point in future solutions.

The benefits are:

- Provide a mechanism to capture knowledge and experience
- Provide a common vocabulary among architects and designers
- Facilitate reuse of approaches that have been successful elsewhere; thus, contributing towards the following aspects of a project by:
 - Reducing risk
 - Increasing quality
 - Improving delivery time

“One thing expert designers know not to do is to solve every problem from first principles. Rather, they reuse solutions that have worked for them in the past. When they find a good solution, they use it again and again. Such experience is part of what makes them experts.”

Design Patterns, Gamma, Helm, Johnson & Vlissides 1995

Do not assume !
Ask and question whenever possible to
reduce your risk

WHY vs. RISK

- Context, Common Sense and Communication
- Remember there are different ways of producing an IT Architecture and learn when to use the appropriate technique.
- Use methods, modelling languages and design tools to enable re-use of IT Architecture assets.
- Patterns are important. Don't assume that your problem is "first-of-a-kind". Use patterns to break down the complexity of your problem.
